Network Topology Design

Our network will consist of two distinct local area networks connected across a Wide Area Network (WAN) using routers:

- LAN 1 (Wired LAN): A star topology featuring a switch and wired PCs connected via copper straight-through cables.
- LAN 2 (Wireless LAN): A wireless network featuring a wireless router/access point connecting wireless laptops and tablets via radio frequency (RF).
- WAN Link: A direct serial or crossover connection between the two gateway routers representing a wide-area link.
